AIM:Write the process to install Xampp server and host a webpage on your remote desktop

1. Introduction to XAMPP

XAMPP is an open-source and cross-platform web server solution package developed by Apache Friends.

It stands for:

X → Cross-platform (Windows, Linux, Mac)

A → Apache (web server)

M → MySQL (database server)

P → PHP (server-side scripting language)

P → Perl (programming language)

It allows you to develop, test, and host web applications locally or on a remote desktop easily.

2. Steps to Install XAMPP on Your Remote Desktop:

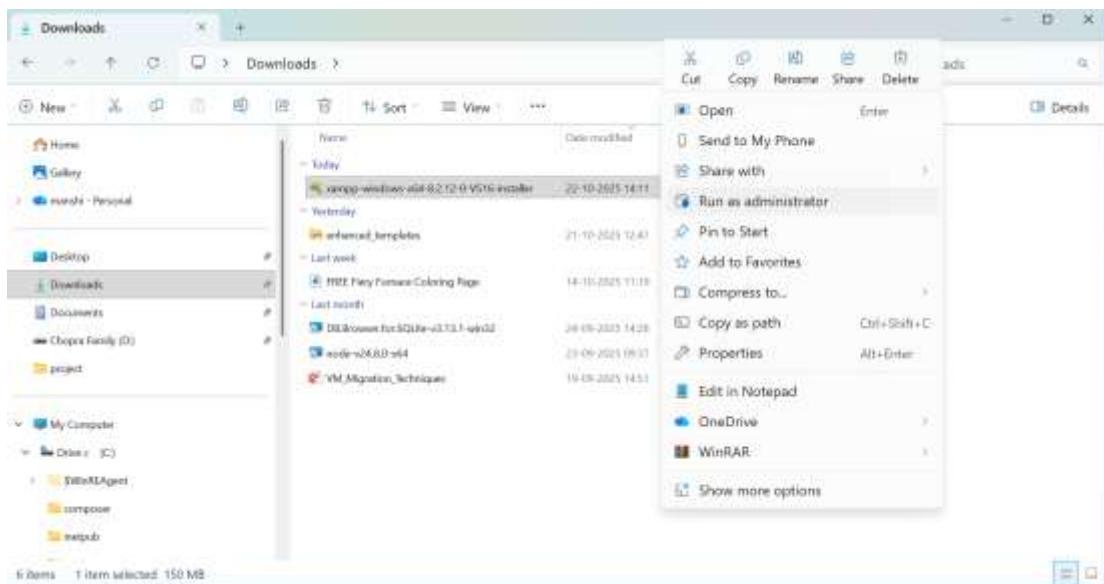

Step 1: Download XAMPP

- Open your web browser and go to the official XAMPP website:
 <https://www.apachefriends.org>
- Choose your operating system (Windows, Linux, or macOS).
- Click the Download button for the latest stable version of XAMPP.

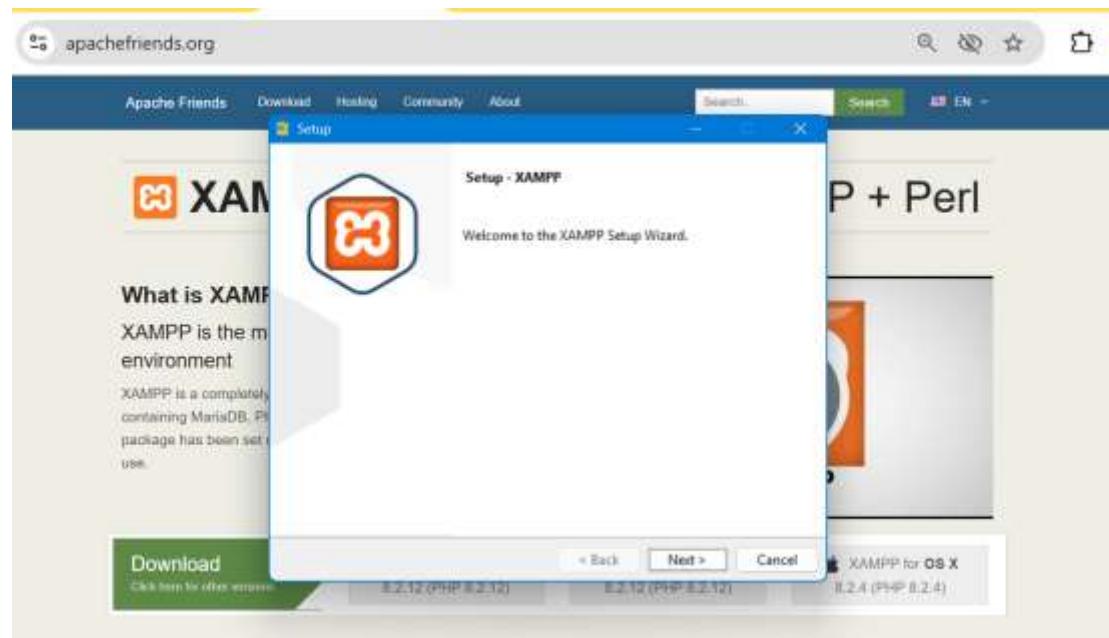

Step 2: Run the Installer

- Locate the downloaded file (e.g., xampp-windows-x64-x.x.x-installer.exe) in your Downloads folder.
- Right-click and select “Run as Administrator.”
- A User Account Control (UAC) warning may appear — click Yes to proceed.

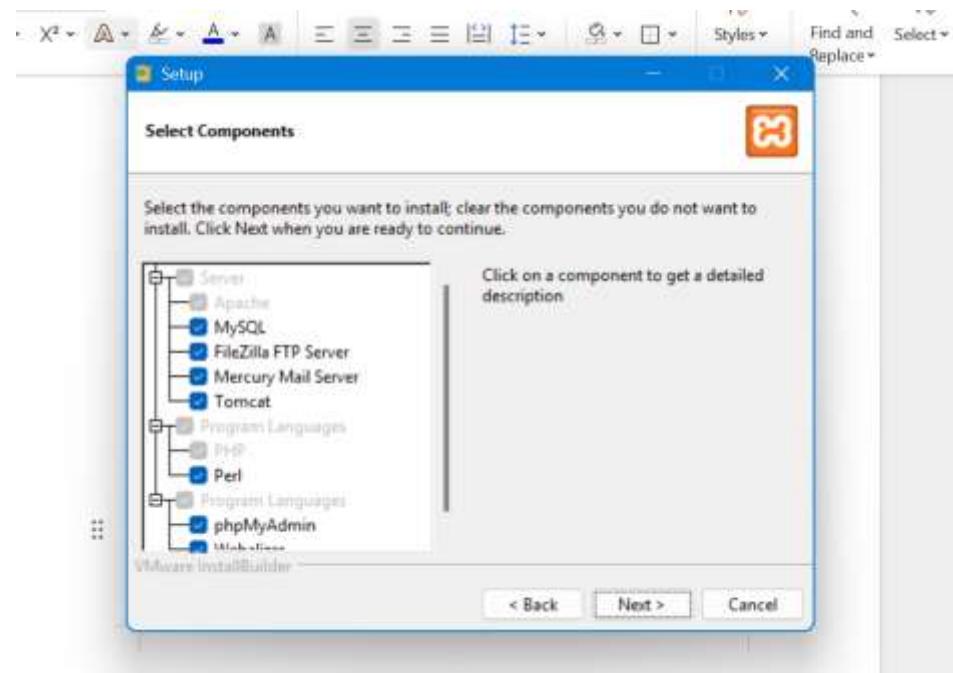

Step 3: Installation Wizard

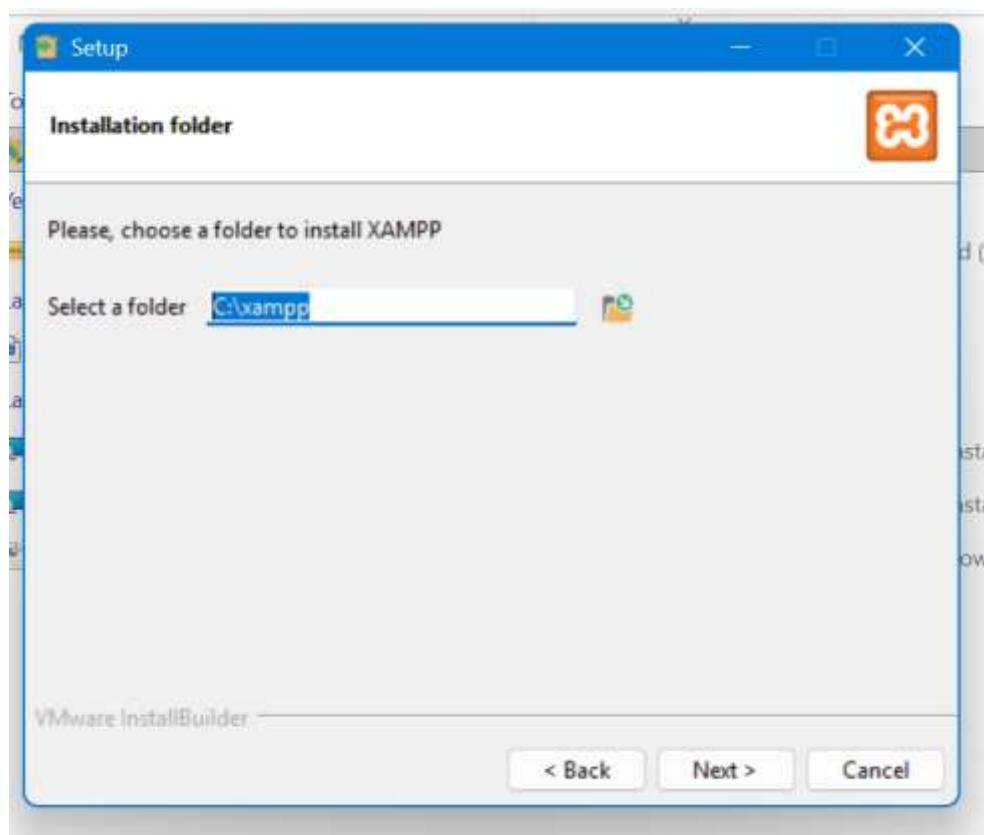

- The XAMPP Setup Wizard opens. Click Next.

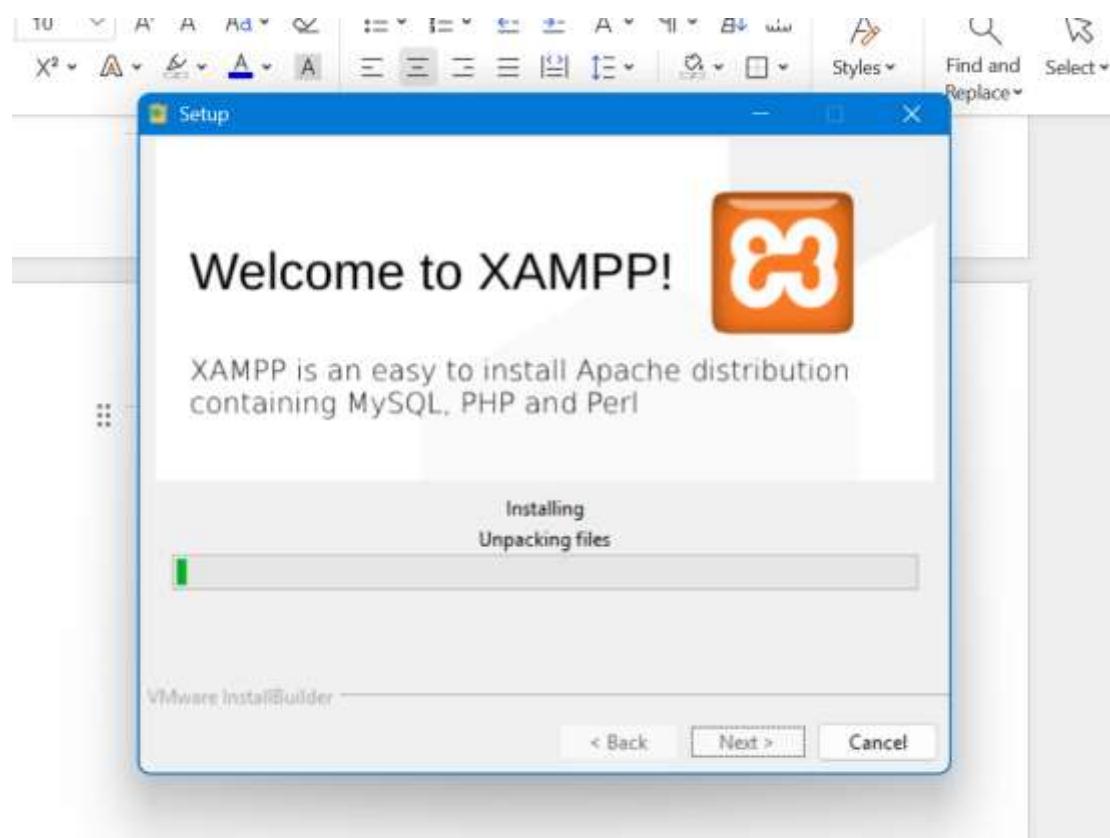

- Choose components you want to install (recommended: Apache, MySQL, PHP, phpMyAdmin).

- Choose the installation folder — default is:

- Click Next → then Next again to start installation.

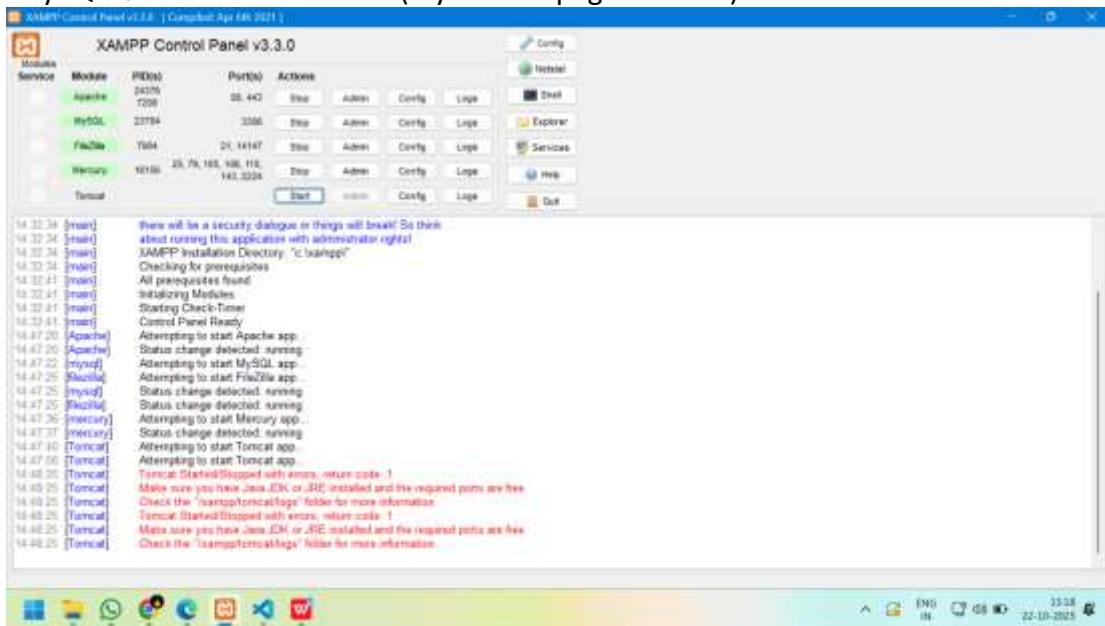

- Wait until installation completes, then click Finish to launch the XAMPP Control Panel.

Step 4: Start XAMPP Services

1. Open the XAMPP Control Panel.
2. Click Start next to Apache and MySQL modules.
3. Once they turn green, it means both services are running correctly.

Apache → Handles webpage hosting.

MySQL → Handles databases (if your webpage needs it).

4. Open a web browser and type: <http://localhost>

If the XAMPP Welcome page appears — your installation is successful.

3. Hosting a Webpage on XAMPP (Remote Desktop):

Step 1: Locate the “htdocs” Folder

- Navigate to: C:\xampp\htdocs

This folder is the root directory for hosting your website files.

Step 2: Add Your Webpage Files

- Create a new folder inside htdocs, for example:

C:\xampp\htdocs\mysite

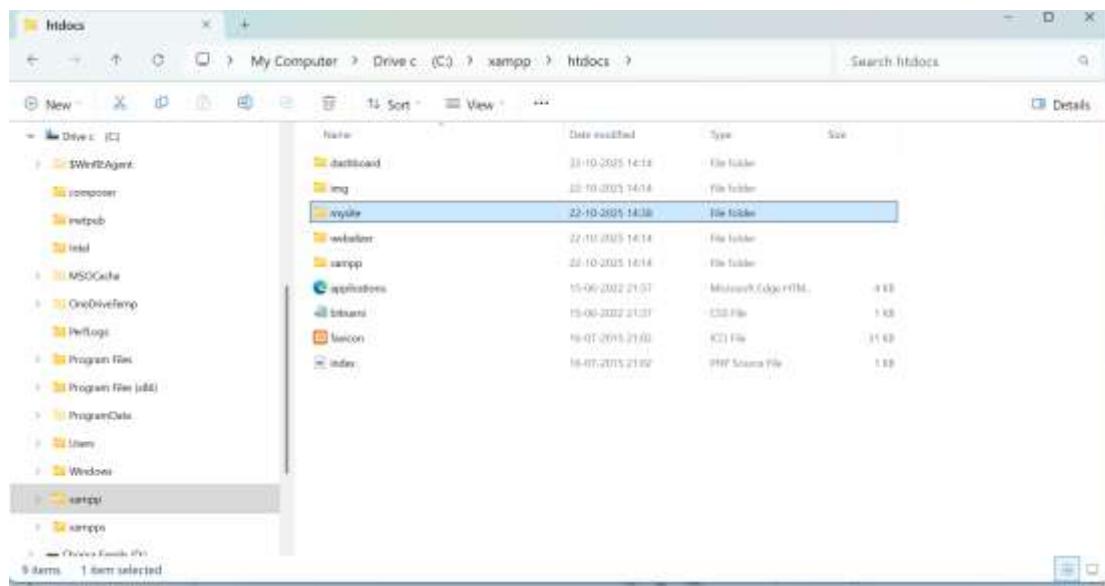

- Copy all your webpage files (HTML, CSS, JS, PHP, etc.) into this folder.

Example:

index.html

style.css

script.js

Step 3: Test the Webpage Locally

- Open your browser and type:

<http://localhost/mywebsite>

- Your webpage should now load correctly.
